Slide 2: Problem Statement ([redacted])

1. Current Challenges in Manual Testing:

• **High Time Consumption:** Manually executing test cases sequentially takes significant effort and delays project deployment.

([redacted])

• **Prone to Human Errors:** Repetitive test execution leads to fatigue, causing critical bugs or edge cases to go unnoticed.

([redacted])

• **Lack of Reusability:** Test data and test scripts cannot be easily reused across different builds or versions of the application.

([redacted])

2. Core Impact:

Without an automated validation process using robust IDE tools like Eclipse, ensuring software reliability and 100% test coverage within tight final year project deadlines becomes highly impractical.
